If people want morphs done or their FWHR measured, make sure to take the pics from a distance around 1-2 meters. Otherwise, due to the type of lens most phone cameras use you will get incorrect FWHR measurements if taken up close, this also makes it more awkward to morph. Creating the thread so we don't have to keep making countless posts on the subject and so people can be easily linked here.

Quote:

The iPhone's lens has a (35mm equivalent) focal length of 29mm.

Quote:

You can really see the 5-eye-line in the beauty shot above that was taken from a distance with a long lens. The sides of the model's head are evident.

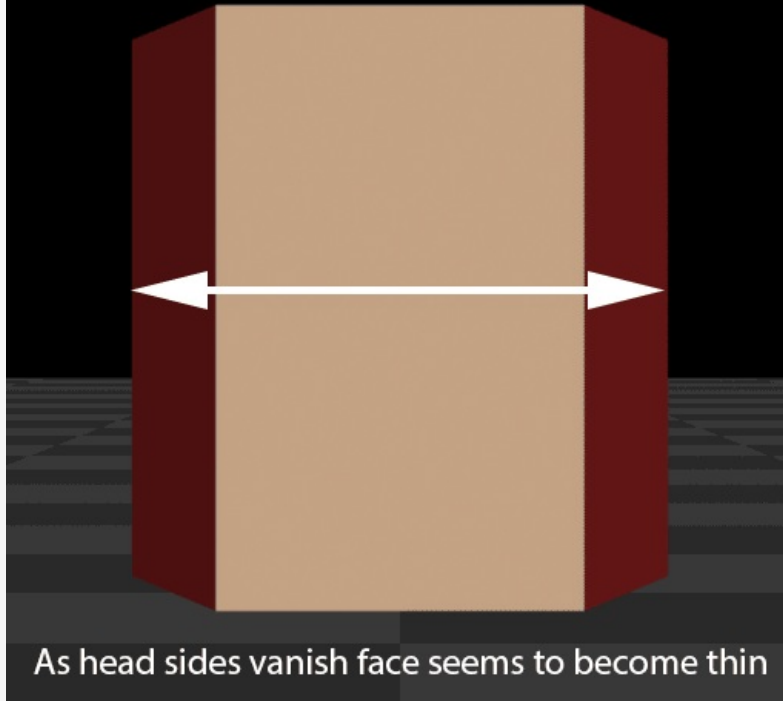

In the wide-angle closeup shot, the '5-eye line' is almost a '3-eye line,' and the side planes of the model's head are no longer visible.

Quote:

A simple dolly inward. The box has non-parallel wedge-like sides, as does a skull.

Zoom wide during the dolly in to keep frame

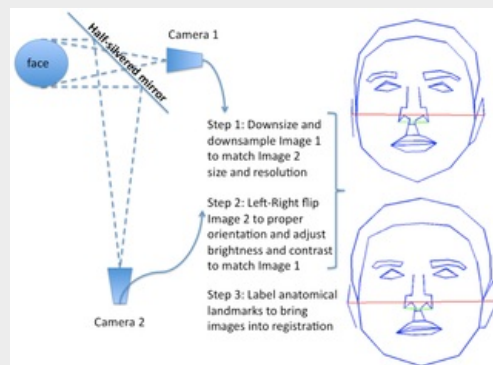

Here is a great post by [The German Dream](#) which he made back in 2014.

GermanDream Wrote:

TLDR: we could all be alot uglier or alot more handsome than we think we are

how do you figure out how you really look like without distance distortion?

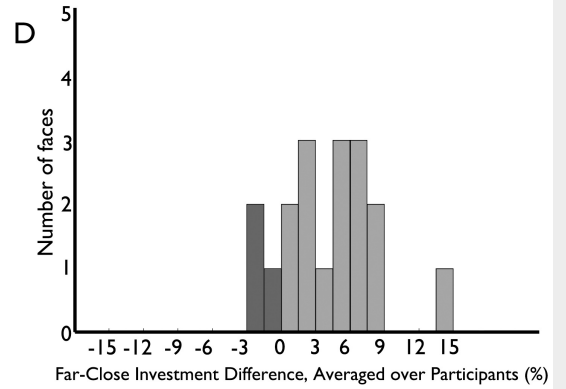

this is a picture of the same face at the exact same moment recorded with two cameras. the close one was 45cm away and the far one 135cm using this technique:

Study 1

Study 2

As we can see the picture further away is a lot more aesthetic and it was also rated more attractive in the study. I remind you the pictures were taken at the exact same moment with the same lighting, expression etc.

we also all know pictures like that:

85mm @ 200cm 35mm @ 85cm 16mm @ 40cm 12mm @ 30cm 8mm @ 20cm

UN-ATTRACTIVE
Wide angle lens
standing very close

MILDLY ATTRACTIVE
30mm lens standing
too close

DEVASTATINGLY ATTRACTIVE!!
50mm lens standing
further back

which demonstrate mostly the distortion due to distance vs flattening the face at bigger distances.

how do you know how you really look like? if you are too close the camera might make your face too narrow and the nose too big (because it is proportionally alot closer to the camera now than any other part of the face), if the camera is too far it might give you a wider skull and flatter face.

how do you know how other perceive you?

do you become worse looking the closer the other person is to you? but ive never experienced someone becoming worse looking when i came closer to them so i dont know how that would pan out.
whats one really look like?

Legit, the same thing applies to profile pictures. If you take a picture and have your nose/eyes/mouth in focus they will appear bigger if the focal length isn't high enough.

what ive been asking myself lately tho:
yes, closeup/short focal lenses distort the face in a negative way, there is no doubt, but the question is, when do pictures taken from afar/with long focal length distort the pictures in a positive way?
there must be a certain setting of variables which lead to a most realistic representation of the face with the least possible positive or negative distortion

Decay

Is there dignity in living life as an entity?
Born into ruin, we feel withdrawal
Subhumanity is poison
And we are lost without a cure
We are not fit to walk amongst them
Eventually this is something we must accept
The world moves on without us
And only the grave welcomes us with open arms
So pray for your rebirth
Pray for another chance to bloom
While the rats will feed off of our failure
We wither away rotted from the core
Welcome to your new home

nice summary.

This problem continues to exist because women take more than 80% (made that up, can't be bothered to look up the obvious) of selfies and the narrowing effect of the shorter focal length has a feminizing effect. The lens distortion actually makes fat women look thinner and more feminine. If lens distortion made women fatter or more masculine looking this would be common knowledge and phone camera makers would have better technologies in their phone cameras by now.

Someone should make one of those multifocal length arrays with a woman with a fat face. I'd bet the fattie looks better at 25mm then at 100mm

wow, I just noticed this for the first time despite seeing these types of arrays many times before, the shorter focal lengths cause the hairlines to recess.

Face>(Body/height)>Status>(Location/propinquity)>(Personality/voice)>Money>everything else aka FBSLPM
eye area>jaw line> (Teeth/bridge/philtrum)>skin>hair>skull size>everything else face

The mass of men lead lives of quiet desperation

its really astonishing how much better i look when i take pictures from ~2m distance compared to maximum hand reach which is like ~0.8m with a standard phone camera lens (which is 35mm i think). but this then might be distorted in such a way that it favours my looks. im still wondering what distance might represent the most realistic view: i hope its like 2m...but it might actually be closer to like 1m or something

Women can still pull off a portrait at short focal length, but for most men it's a death sentence. Makes face narrower, completely kills jawline and chin, just messes up all proportions. Stay the fuck away from selfies.

50mm

200mm

I have found a website that provides seemingly legit, comprehensive and intelligent ratings of cameras. Based upon its ratings of compact cameras for portraits I am going to order the Fujifilm S1, it is not the top rated portrait camera, but it is the highest rated portrait camera under \$500 and it has a fully articulated viewing screen and everything a sane person could want in a camera.
<http://cameradecision.com/features/Best-...hotography>. There are places on the web that sell it for under \$300.

I also did some research on selfie sticks, and came to the conclusion they are worthless (unless you are taking pictures of your ass) as they will shake too much and give a blurry picture

I think the most important would be getting a stand so you can get reasonably far from the camera (at least 2m far) and use a timer with your shots or maybe nowadays you can control the camera with an app or something

No.

When it comes to proper cameras, it's all about the size of the sensor. https://en.wikipedia.org/wiki/Image_sensor_format

That Fuji S1 has a tiny 1/2.3" sensor. Basically, it'll produce pictures not much better than phones.

If you want something light, compact and cheap, I suggest you get Sony A6000 (APS-C sensor, 12 times larger surface area than 1/2.3") and SEL50F18 lens (best for portraits).

PS - aren't you super rich? If I were you, I'd actually get something along the lines of Sony A7RII + Zeiss Batis 85mm. This is the sort of quality you can expect with this combo:

Selecting a Portrait Lens With Correct Focal Length

<http://petapixel.com/2016/01/04/selectin...al-length/>

Quote:

Hence whatever facial feature happens to be closest to the lens will take up more real estate on the film plane than those featured that biologically occur farther away. The one unfortunate body part that most often bares the brunt of this inevitability is the nose. In the drawing below you can see how the distance from lens to the nose vs. eyebrow changes with various focal lengths – the shorter the lens the greater the difference in those distances and the bigger the nose will appear in the photo.
